

Introduction Project

To understand how AviX can enhance productivity, Prologia offers an introduction project.

The purpose of our introduction project is to show, in a tangible and realistic way, the results one can quickly achieve using AviX. An introduction project is run in a defined production area with your personnel. At the end of the project proposals for improvements are presented.

A introduction project generally takes up to three days, but can be extended if so desired. It is conducted, by a Prologia representative who offers an introduction, videotapes, analyzes and makes improvements alongside your personnel. The findings are consolidated and presented.

To run a introduction project, we suggest that you, in consultation with Prologia, choose a suitable area in your production line. Input from all your personnel is encouraged.

Husqvarna, ABB, SKF, Ericsson and Siemens recommend introduction projects.

Feel free to contact us at your convenience.
